# Subject: Assignment 3 Part 1
# Date:    11/24/2020
################################################################################
# MIPS assembly language translation of a given C++ program that, except for the
# main function, involves "trivial" functions each of which:
# - is a leaf function
# - does not require local storage (on the stack)
# NOTES:
# - "does not require local storage" means each (leaf) function
#   -- does not need memory on the stack for local variables (including arrays)
#   -- WILL NOT use any callee-saved registers ($s0 through $s7)
# - meant as an exercise for familiarizing w/ the
#   -- basics of MIPS' function-call mechanism
#   -- how-to's of pass-by-value & pass-by-address when doing functions in MIPS
# - does NOT adhere to yet-to-be-studied function-call convention (which is
#   needed when doing functions in general, not just "trivial" functions)
# - main (being the only non-"trivial" function & an unavoidable one) will in
#   fact violate the yet-to-be-studied function-call convention
#   -- due to this, each of the functions that main calls MUST TAKE ANOMALOUS
#      CARE not to "clobber" the contents of registers that main uses & expects
#      to be preserved across calls
#   -- experiencing the pains and appreciating the undesirability of having to
#      deal with the ANOMALOUS SITUATION (due to the non-observance of any
#      function-call convention that governs caller-callee relationship) should
#      help in understanding why some function-call convention must be defined
#      and observed
################################################################################
